

Media Organizer Pro

OFFICIAL USER GUIDE & OPERATIONS MANUAL

Welcome to **Media Organizer Pro**. This desktop tool is designed to provide a lightweight, high-performance workspace for scanning, previewing, managing, and restructuring large asset folders of images and video files. This document details the setup, core layout mechanisms, and specific operational steps needed for an efficient workflow.

1. System Configuration & Preferences

The application maintains an integrated persistence engine via Windows Local Preferences. When you launch the workspace, it automatically restores your previously selected system directories, application hooks, and preferred view sizing to maximize continuous operational speed.

★ Persistent Storage Configuration

Your target folders, custom player assignments, and layout grid density settings remain fully saved even if you close the terminal environment completely or disconnect external storage pools.

Supported Media Signatures

The application runs optimized workspace queries filtering specifically for native media containers. The following file format extensions are actively managed:

- **Image Extensions:** `.jpg`, `.jpeg`, `.png`, `.webp`, `.bmp`
- **Video Extensions:** `.mp4`, `.mov`, `.avi`, `.mkv`

2. Core Interface & Navigation Elements

The layout is divided into three functional zones designed around high-density curation workflows.

The Main View Header

- **Source Folder Button (Folder Icon):** Launches a native file explorer frame to map your primary active working directory.
- **Refresh Button (Sync Icon):** Re-interrogates the storage disk pool instantly, tracking any immediate external additions or deletions.
- **Slideshow Button (Play Icon):** Initiates the automatic visualization sequence exclusively for your discovered image assets.

The Workspace Control Bar (Sub-Header)

Control Interface	Visual Signature	Functional Behavior
Set Target Path	Cyan Indicator	Establishes the permanent destination directory where marked items will be safely packaged and copied.
Set Player Application	Amber Indicator	Bypasses standard Windows default choices. Allows mapping to an explicit local binary file executable (.exe) for media analysis.
Bulk Save Triggers	Solid Cyan Badge	Appears dynamically only when active selections exist. Copies all checked files to your target location in a safe batch thread.

3. Step-by-Step Curation Workflows

Asset Selection, Marking, and Sorting

Individual cards are mounted inside a dynamic grid loop that resizes based on layout width bounds. You can isolate items using dual-layer tagging mechanisms:

- 1. **Card Grid Selection:** Left-click directly onto any image profile or video placeholder block. The card body shifts to a deep blue-grey hue surrounded by a clear Blue Border. This tags the asset globally for continuous multi-file execution steps like Batch Renaming or Bulk Deletion.
- 2. **Target Save Marking:** Left-click the small Checkbox Toggle in the top-left corner of any media card. This marks the specific item for batch-copy preservation workflows.

Renaming & Field Clearing Operations

Every individual media cell includes a customized text modification controller:

- To modify an individual file signature, highlight the text box reading Rename . . . inside the card frame.
- Type the intended asset label name and press the Enter Key or click the green Checkmark Button.
- The underlying native filesystem renames the file immediately. Upon processing, the workspace instantly wipes the input text field blank, resetting the card interface cleanly for immediate sub-sequent actions.

Operational Warning on Video Assets

Video assets are explicitly isolated using safety placeholder thumbnail items marked with an amber movie camera icon. To review or listen to video recordings, click the blue action arrow button to pipe the stream straight into your external media player or dedicated viewer application.

Automated Batch Renaming

To systematically sequence dozens of files instantly, leverage the integrated regular expression sequencing framework:

- Select a row or page of items using main cell left-clicks, then select **Batch Rename** in the lower toolbar.
- Input an alphanumeric common descriptor template prefix (e.g., `FieldDocs_`).
- The engine automatically scans the folder, parses existing structural numbers to eliminate overlapping asset collisions, and instantly sequence-labels your targets (e.g., `FieldDocs_1.jpg` , `FieldDocs_2.jpg` , etc.).

4. Footers & Keyboard Command Shortcuts

The workspace baseline layout exposes immediate data monitoring stats showing your total active workspace capacity (`Selected Count / Total Count`) alongside mathematical layout indexing.

Keyboard Layout Shortcuts

Input Action	Interface Behavior Result
Left / Right Button (< / >)	Flips page view index frames cleanly. Instantly snaps the page scroll offset straight back up to the grid top layout space.
View Dropdown Menu	Alters file layout grid density limitations dynamically. Choose between <code>12</code> , <code>24</code> , <code>48</code> , or <code>100</code> items per page view.
Escape (ESC Key)	Instantly drops and closes out active fullscreen presentation slideshow modes.
